                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Custom primers were used for 5' and 3'-end sequencing. The full-insert sequencing was done by primer-walking method using ABI DNA sequencer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     764._.2026

Submitted (13-MMY-2005) Wellcome Trust Sanger Institute, Hinxton, Cambridgeshire, CB10 15A, UK. E-mail enquiries: vega@sanger.ac.uk Clone requests: clonerequest@sanger.ac.uk on Dec 15, 2000 this sequence version replaced gi:11558491.

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:

Bm:, EMBL, Sw:, SWISSPROT, Tr:, TREMBL; Wp:, WORMPEP; Information on the WORMPEP database can be found at http://www.sanger.ac.uk/Projects/C elegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromosome 6, constructed by the Sanger Centre Chromosome 6 Mapping Group. Further information can be found at http://www.sanger.ac.uk/HGP/Chr6 RP3-492P14 is from the library RPCI-3 constructed by the group of Pieter de Jong. Por further details see http://www.chori.org/bacpac/home.htm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human DNA sequence from clone RP3-492P14 on chromosome 6q13-15 Contains a single stranded DNA binding protein pseudogene, the TPBG gene for trophoblast glycoprotein (5T4-AG) and a CpG island, A1121977

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Genome Seguencing Center, 4444 Forest Park
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Genome Sequencing Center, 4444 Forest Park
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemietry, or covered by high quality data (i.e. phred quality as >=30); an attempt was made to resolve all sequencing problems, such compressions and repeats; all regions were covered by at least one plasmid subclone, fosmid clone or direct clone walk sequence. Sequence from the Mouse Genome Sequencing Consortium whole genome shotgun may have been used to obtain the consensus sequence. The assembly was confirmed by restriction digest.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Bukaryota, Metazoa, Chordata, Craniata, Vertebrata, Buteleostomi,

```

```
This finishing standard has slightly changed from the previous Human standard. Specifically, standards for regions of low sequence complexity (such as dinucleotide repeats and small unit tandem repeats) have been relaxed. These regions are very prevalent in the mouse genome, and the return on extended finishing efforts is
```

If a sequence meets the criteria of the above statement, it needs no comments or tags. If the criteria are not met, such as ambiguous no comments or tags. If the criteria are I bases, then the region is duly annotated.

## MAPPING INFORMATION:

Mapping information for this clone was provided by Dr. Wes Warren, Department of Genetics, Washington University, St. Louis MO. For additional information about the map position of this sequence, see http://genome.wustl.edu

## SOURCE INFORMATION:

The BAC Library has been constructed by Pieter de Jong and coworkers (http://www.chori.org) from male C57BL/63 mouse spleen and/or brain genomic DNA. The clone and detailed information can be obtained from Pieter de Jong and coworkers at http://www.chori.org

This sequence is the entire insert of the clone. Location/Qualifiers

COMMENT

Submitted (19-NOV-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA on Nov 19. 2002 this sequence verseion replaced gi:2356504.

On Nov 19. 2002 this sequence verseion replaced gi:2356504.

The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.hgs.c.bcm.tmc.edu/projects/raf/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome table.

                                                                                                                                                                                                               individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ms to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole sehorgun sequence only contigs will be indicated in the feature table.
                                                                                                                                                                                                                                                                                                                                                                                                                                                             NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html). NOTE: This is a 'working draft' sequence. It currently consists of 4 contigs. The true order of the pieces is not known and their order in this sequence record is
assembly (a 'contig-scaffold'). Within each contig-scaffold,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1 234710: contig of 234710 bp in length

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemister double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30; an attempt was made to resolve all sequencing problems, such as compressions and repeats, all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest.
                                                                                                                                                                                                                                                                                                                     University, 4444 Forest Park Avenue, St. Louis, Missouri 63

Runs of N are used to separate the reads and the order in which they appear is completely arbitrary. Low-pass sequence sampling is useful for identifying clones that may be gene-rich and allows overlap relationships among clones to be deduced. However, its should not be assumed that this clone will be sequenced to completion. In the event that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Contact: sequence_submissions@genome.wi.mit.edu

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence Quality Assessment:
This entry has been annotated with sequence quality estimates computed by the Phrap assembly program.
All manually edited bases have been reduced to quality zero. Quality levels above 40 are expected to have less than 1 error in 10,000 bp.
Base-by-base quality values are not generally visible from the GenBank flat file format but are available as part of this entry's ASN.1 file.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Center Clone name: CTC-790L10

Sequencing vector: pUC18; 100% of reads
Sequencing vector: pUC18; 100% of reads
Chemistry: Dye-terminator Big Dye; 100% of reads
Assembly program: Phrap; version 0.990329
Consensus quality: 110433 bases at least Q40
Consensus quality: 110887 bases at least Q30
Consensus quality: 111058 bases at least Q30
Quality coverage: 9.56x.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          2 (bases 1 to 111108)

CLONE LENGTH: This sequence does not necessarily represent the entire insert of this clone. Overlapping regions of clones are only sequenced and submitted once, so the sequence for the remainder of the insert may be found in the record for the adjacent clones. Overlapping clones are noted at the beginning and end of the Peatures listing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ANNOTATION OF FEATURES:

STSS are identified using ePCR (Genome Res. 7:541-550) searches of a local database that includes entries from dbSTS, GDB, and local mapping efforts.

Repeats are identified using RepeatMasker (A. Smit and P. Green, unpublished.) for Human and Mouse sequences.

Genes and Region of sequence similarity (expect < 1e-34) to the BST and cDNA sequences Genes demonstrate at least two exons flanked by consensus splice sites that maintained sequence continuity across the splice junctions. Sequences that are not identical matches are annotated as similar.
Worley, K.C.
Direct Submitssion
Submitted (21-AUG-2001) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA ON NOV 1, 2000 this sequence version replaced gi:10645203.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SEQUENCING READ COVERAGE:Sequencing is completed to a minimum standard of double strand coverage with a minimum of 2 clones and reads with no ambiguities or 2 chemistries with a minimum of 2 clones and 3 reads with no ambiguities. If the sequence quality fo a region does not meet this standard, it will be indicated in the annotation as Low Coverage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 QUALITY OF INDIVIDUAL BASES:This sequence meets stringent quality standards - estimated error rate less than 1 per 10,000 bases. Reports of lowest quality individual bases and measures of base quality are listed below. Description of the metrics can be found
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cttagagtgg (t) gggataaggt

It currently consists of 6 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Center Clohe name: 11 G.5
Sequencing vector: M113 M77815, 100% of reads
Sequencing vector: M13, M77815, 100% of reads
Chemistry: Dye-terminator Big Dye; 100% of reads
Assembly program: Phrap; version 0.960731
Consensus quality: 17439 bases at least Q40
Consensus quality: 17428 bases at least Q20

```

The invention comprises a method of detecting a breast cancer-associated transcript in a cell from a patient. The method of the invention involves contacting a biological sample from the patient with a nucleotide that hybridises to one of the 69 breast cancer-associated gene sequences shown in the specification. The method of the invention is useful in the diagnosis or prognosis of breast cancer, and for descriping that are up or down-regulated in breast cancer calls. Genes identified by the method of the invention can be used in diagnostic purposes and also as targets for screening for therapeutic compounds that modulate breast cancer (e.g. hormones or antibodies). Identification of genes that are over or under expressed in breast cancer can additionally provide high-resolution, high-sensitivity datasets which can be used in the areas of diagnostics, therapeutics, drug development, pharmacogenetics, protein structure and biosensor development. DNA sequences ABT07633 - ABT07761 represent the 69 breast cancer-associated gene sequences of the invention

Sequence 927 BP; 187 A; 297 C; 240 G; 203 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                    transcript in a cell from a patient, comprising contacting a biological sample from the patient with a polymucleotide that selectively hybridises to a sequence that is at least 80 % identical to a gene that exhibits to a sequence that is at least 80 % identical to a gene that exhibits increased or decreased expression in lung cancer samples. Lung cancer compound that modulates a lung cancer-associated polypeptide, for inhibiting proliferation of a lung cancer-associated cell to treat lung cancer in a patient and for treating a memmal having lung cancer by administering a modulatory compound identified. The methods are useful for treating a modulatory compound identified. The methods are useful for treating lung cancer, such as small cell lung cancer, non-small cell ung cancer or other benign or precancerous leations, e.g. atelectasis, emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis, hypersensitivity pneumonitis, intersitial pulmonary disease, fibrosis, bronchiectasis. The genes, polymucleotides and polypeptides are useful compounds that modulate lung cancer, such as antibodies. Sequences compounds that modulate lung cancer, such as antibodies. Sequences

```
Detecting an ovarian cancer-associated transcript in a cell from a patient, comprises contacting a biological sample from the patient with a polynucleotide that hybridizes to an ovarian cancer gene.
                                                                                                                                                                                                                                                          selectively
                                                                                                                                                                                     The invention relates to a method of detecting an ovarian cancerassociated transcript in a cell from a patient, by contacting a biological sample from the patient with a polymucleotide that selectivel hybridizes to a sequence at least 80% identical to any of one of 80 mucleic acid sequences given in the specification. The method is useful in diagnosing ovarian cancer and in identifying and using agents and/or targets that inhibit ovarian cancer. The nucleic acid molecule, polypeptide and the antibody may also be used in detecting ovarian cancers, monitoring and early detection of relapse following treatment, monitoring response to therapy, selecting patients for post-operative chemotherapy or radiation therapy, in selecting mode of therapy, detection of pre-cancerous lesions, and as vaccines. This sequence corresponds to one of the nucleic acids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Cancer/angiogenesis/fibrosis-related nucleic acid, SEQ ID NO:41.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 927 BP; 187 A; 297 C; 240 G; 203 T; 0 U; 0 Other;

whose expression is upregulated or downregulated in specific cancers or other diseases such as angiogenic or fibrotic disorders, and to methods of determining the presence or absence of a pathological cell in a patient by detecting a nucleic acid at least 80% identical to those of the invention or by detecting a polypeptide of the invention. The invention also relates to expression vectors and host cells comprising a nucleic acid of the invention, antibodies which specifically bind and methods of the invention; use of such antibodies for drug targeting; and methods of screening for modulators of activity or expression of the polypeptides and nucleic acids. The nucleic acids, polypeptides, and nucleic acids. The nucleic acids, polypeptides and methods are useful for diagnosing, prognosing and treating cancer and other conditions such as psoriasis, ischaemia, heart disease, atherosclerosis, inflammatory diseases, autoimmune disease, retinal neovascularistaion syndromes, scarring and uterine fibroids. They may also be useful in wound healing and in contraception. The present sequence represents a nucleic acid sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Determining the presence or absence of a pathological cell in a patient, useful for diagnosing, prognosing or treating cancer, comprises detecting a nucleic acid in a biological sample.

The invention relates to a method of identifying a candidate p53 pathway modulating agent. The method involves contacting an assay system comprising a purified Leucine rich repeat, capricious related (LRRCAPS) polypeptide or nuclead acid or its fragment with a test agent and detecting a test agent-biased activity, where a difference between the test agent-biased activity, where a difference between the agent as a candidate p53 pathway modulating agent. The method is useful for identifying a candidate p53 pathway-modulating agent for preparing composition for diagnosing or treating cancer. The invention is useful in gene therapy. The present sequence is human LRRCAPS related DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Identifying a candidate p53 pathway-modulating agent for treating cancer comprises contacting an assay system comprising a purified leucine rich repeat, capricious related polypeptide or nucleic acid with a test agent.

New NOVX polypeptides and polymucleotides, useful for preventing, diagnosing or treating NOVX-associated disorders e.g. diabetes, cancer, Alzheimer's disease, dyslipidemias, obesity, immune or hematopoietic disorders, and asthma.

WPI; 2002-732824/79.

P-PSDB; ABP70071.

Claim 16; Page 114-115; 619pp; English.

The present invention relates to new isolated proteins (NOVX) and their coding sequences (ABV99327-ABV99595 and ABP70049-ABP70149), where X is any number from 1 to 48. The NOVX proteins and coding sequences are useful in the manufacture of andicament for treating a syndrome associated with a human disease, preferably a NOVX-associated disorder. The NOVX coding sequences and proteins are useful for treating, preventing or disquences and proteins are useful for treating, concert, infectious diseases, anorexia, cancer-associated cachexia, cancer, neurodegenerative diseases ancerial associated cachexia, cancer, neurodegenerative diseases, Alzheimer's disease, parkinson's disorders, fertility, bronchial asthma, AIDS, dyslipidemia, metabolic disturbances associated with obesity, metabolic syndrome X or wasting disorders associated with obesity, metabolic syndrome X or wasting disorders associated with obesity, metabolic syndrome X or wasting cidentification of small molecules that modulate or inhibit e.g. neurogenesis, call differentiation, call proliferation, haematopoiesis, wound healing and anglogenesis, in gene therapy, in generation of antibodies that bind immunospecifically to NOVX substances for use in therapeutic or diagnostic methods

Sequence 1156 BP; 228 A; 383 C; 303 G; 242 T; 0 U; 0 Other;

                                                                                                                                                                          Key
 The present sequence encodes the human 5T4 tumour-associated antigen (TAA). The TAA 5T4 is a glycoprotein which is widely expressed in carcinomas but has a highly restricted expression pattern in normal adult tissues. It appears to be strongly correlated to metastasis in colorectal and gastric cancer. 5T4 antigen may therefore be useful in tumour diagnosis, targeting and immunotherapy. Mice in which tumours had been induced were incoulated with a virus expression vector containing the present sequence. The 5T4 antigen was shown to be effective at eliciting an immunotherapeutic anti-tumour response. Both the nucleic acid encoding the antigen and the antigen itself can be used to elicit an immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                 Tumor associated antigen, 5T4 capable of eliciting cytotoxic T-lymphocyte response useful in vaccinating against and in treating tumors.

The specification describes the use of a single chain antibody (SCFV), which is capable of recognizing a disease associated molecule in the manufacture of a medicament for the prevention and treatment of a disease condition. The SCFV antibody is useful in the manufacture of a disease medicament, for affecting a disease in vivo, for preparing a pharmaceutical composition, for in vivo imaging and/or for adjuvant treatment of a disease. The SCFV antibody is also useful for treating inflammatory diseases including arthritis, hypersensitivity, autoimmune disease, cancers, central nervous system disorders including Parkinson's disease, gastrointestinal disorders, infections, diabetes, Helicobacterrelated diseases, and other immune disorders. The present sequence encodes a 574 protein, which is used to produce SCFV of the invention
Use of single chain antibody capable of recognizing a disease associated molecule for manufacturing a medicament for preventing and/or treating a disease condition associated with disease associated molecule.

The present invention relates to the isolation of canine and feline oncofoetal leucine-rich glycoproteins known as 574, and the polynucleotide sequences encoding them. The 574 proteins are expressed in a polynucleotide sequences encoding them. The 574 proteins are expressed in a significant proportion of tumours. The sequences of the invention are useful in a pharmaceutical composition for the prevention and/or treatment of tumours or other diseases associated with cell preferably dogs or cats. The compositions may also be used for cancer immunotherapy in these animals. The sequences of the invention may also be used in diagnostic kits for rapid, reliable, sensitive, and specific measurement and localisation of 574 in extracts of plasma, urine, tissues, and in cell culture media. Antibodies specific for the 574 protein are useful for isolating foetal cells from maternal blood. The isolation process may form part of a diagnostic method e.g. the foetal cells may then be subject to biochemical or genetic sampling used for testing foetal abnormalities, or to determine the sex of the foetus(es). The present sequence encodes canine 574 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ij

The invention relates to a method of identifying a candidate p53 pathway modulating agent. The method involves contacting an assay system comprising a purified Leucine rich repeat, capricious related (LRRCAPS) polypeptide or nucleic acid or its fragment with a test agent and detecting a test agent-biased activity, where a difference between the test agent-biased activity, where a difference between the agent as a candidate p53 pathway modulating agent. The method is useful for identifying a candidate p53 pathway-modulating agent for preparing a composition for diagnosing or treating cancer. The invention is useful in gene therapy. The present sequence is human LRRCAPS related DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 1331 BP; 252 A; 447 C; 369 G; 263 T; 0 U; 0 Other;

This invention relates to novel isolated cDNAs that are differentially expressed in MYCN activated cells. Specifically, it refers to polymucleotide sequences that exhibit differential expression patterns in cells activated by the transactivator MYCN, where MYCN is a proton oncogene that is amplified in neuroblastoms cells and is common in small cell lung cancers. The present invention describes these cDNA molecules as useful for in hybridisation assays to detect expression of nucleic acids for complementary nucleic acids) in a present in a given sample, as well as for screening assays by identifying molecules or compounds that specifically bind the cDNA as a ligand and modulate function or activity. Accordingly, these compositions exhibit cytostatic activity and can also that is differentially expressed in MYCN activated cells, given in an exemplification of the invention. NOTE: This sequence does not appear in the printed specification but has been obtained in electronic format from
                                                                                                                                                                                                                                                                                                                                                                                                        New genes regulated by MYCN activation, useful in gene therapy, particularly for treating a subject with e.g. neuroblastoma or other cancers, or for diagnosing, staging or monitoring the treatment of the
                                                       Human cDNA differentially expressed in MYCN activated cells SeqID 105

The present invention describes a method for detecting a bladder cancerassociated transcript in a cell from a patient. The method comprises contacting a biological sample from the patient with a polymuclecide that selectively hybridises to a sequence that is 80 % identical to a table of sequences (see ACC50951 to ACC5095). ACC50951 to ACC51059 concode the human bladder cancer-associated proteins given in ABR48146 to ABR48242). Bladder cancer-associated proteins given in haraquist cancer-associated sequences from the present invention have cytostatic activities, and can be used in antisense gene therapy and in vaccine production. The method can be used for detecting a bladder cancer-associated transcript in a cell from a patient. The method is useful in diagnosing or treating bladder cancer and in screening for compounds that modulate bladder cancer, such as hormones or antibodies. The nucleic acid molecules from the present invention may be used in various screening and diagnostic matchods, and for gene therapy, vaccine and/or antisense/inhibition applications.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 2053 BP; 461 A; 602 C; 499 G; 491 T; 0 U; 0 Other;

Detecting a lung cancer-associated transcript in a cell from a patient for treating lung cancer, by contacting a biological sample from the patient with a polymucleotide that exhibits increased or decreased expression in lung cancer.

Claim 22; Page 335; 453pp; English.

The invention relates to a method for detecting a lung cancer-associated transcript in a cell from a patient, comprising contacting a blological sample from the patient with a polymucleotide that selectively hybridises to a sequence that is at least 80 % identical to a gene that exhibits con a sequence that is at least 80 % identical to a gene that exhibits compound that modulates a lung cancer associated for identifying a compound that modulates a lung cancer-associated for identifying a compound that modulates a lung cancer-associated cell to treat lung cancer in a patient and for treating a mammal having lung cancer by administering a modulatory compound identified. The methods are useful for treating lung cancer, such as small cell lung cancer, non-small cell ung cancer or other benign or precancerous lesions, e.g. atleetessis, emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis, complyaema, bronchitis, intersitial pulmonary disease, fibrosis, bronchiectasis The genes, polymucleotides and polypeptides are useful confounds that modulate lung cancer, such as antibodies. The invention relates to a method of identifying a candidate p53 pathway modulating agent. The method involves contacting an assay system comprising a purified Leucine rich repeat, capricious related (LRRCAPS) polypeptide or nucileacid or its fragment with a test agent and detecting a test agent-biased activity, where a difference between the test agent-biased activity, where a difference between the agent as a candidate p53 pathway modulating agent. The method is useful for identifying a candidate p53 pathway-modulating agent for preparing a composition for diagnosing or treating cancer. The invention is useful in gene therapy. The present sequence is human LRRCAPS DNA

The method is useful for identifying a candidate p53 pathway-modulating agent for preparing a composition for diagnosing or treating cancer. The invention is useful in gene therapy. The present sequence is human LRRCAPS DNA
                                                                                                                                                                                                                                                                                                                                                                                                                         cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                        comprises contacting an assay system comprising a purified leucine rich repeat, capricious related polypeptide or nucleic acid with a test agent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human, differential expression, cancer, angiogenic disorder;

The invention relates to nucleic acids and proteins (ADN38683-ADN40064)
whose expression is upregulated or downregulated in specific cancers or
other diseases such as angiogenic or fibrotic disorders, and to methods
of determining the presence or absence of a pathological call in a
conference of a pathological call in a
conference or absence of a pathological call in a
conference or absence of a pathological call in a
conference or by detecting a nocleic acid at least 80% identical to those of
the invention or by detecting a polypeptide of the invention. The
conclet acid of the invention; antibodies which specifically bind a
conclet acid of the invention; use of such antibodies for drug targeting;
conclet and methods are useful for disgnosing, prognosing and treating
concer and other conditions such as psoriasis, ischaemia, heart disease,
concer and other conditions such as psoriasis, ischaemia, heart disease,
concer and other conditions such as psoriasis, ischaemia, retinal
neovascularistaion syndromes, scarring and uterine fibroids. They may
also be useful in wound healing and in contraception. The present
concer sequence represents a nucleic acid sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Determining the presence or absence of a pathological cell in a patient, useful for diagnosing, prognosing or treating cancer, comprises detecting a nucleic acid in a biological sample.
retinal neovascularistaion syndrome; scarring; uterine fibroid; detection; diagnosis; prognosis; drug screening; drug targeting; dewond healing; contraception; cytostatic; cardiant; immunomodulatory; vulnerary; gene therapy; vaccine; gene; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gish KC, Glynne R, Hevezi PA;

The invention relates to novel polynucleotide and polypeptides for treating psoriasis or a sequence having at least 80% identity to the above sequences. The nucleic acid is useful for preparing a composition for diagnosing or treating peoriasis in a mammal. This sequence corresponds to one of the polynucleotides of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New PRO nucleic acid or polypeptide, useful for preparing a pharmaceutical composition for diagnosing or treating psoriasis in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to the isolation of human tumour-associated antigenic target (TAT) polynucleotide and polypeptide sequences. Also disclosed is an antibody that binds to a TAT polypeptide. The antibody is a monoclonal antibody, an antibody fragment, a chimeric antibody or humanised antibody. It is conjugated to a growth inhibitory agent. It is produced in bacteria or in CHO cells and induces death of a cell to which it binds. The antibody is useful for preparing a composition for represents or treating tumours and cancer. The present sequence represents a human TAT cDNA sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Hillan KJ, Polakis P, Polson A, Smith V;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New antibody that binds to a tumor-associated antigenic target (TAT) polypeptide, useful for preparing a composition for diagnosing or treating cancer.

The invention relates to a method of classifying a breast cancer patient according to prognosis by determining the similarity between the level of expression of each of five genes for which markers are listed in the specification, in a cell sample taken from the breast cancer patient, to control levels of expression for each respective five genes to obtain a patient similarity value. The methods are useful for classifying a breast cancer patient according to prognosis. Kits and computer program products are useful for data analysis using the disgnostic, prognostic and statistical methods of the invention. This sequence corresponds to a
                                                                                                                                                                                                                                                                                                                                Classifying a breast cancer patient according to prognosis comprises determining the similarity between the level of expression of each of five genes in a cell sample taken from patient, to control levels.

```

The invention relates to human tumour-associated antigenic target (TAT) polypeptides, and their related nucleic acids. The TAT polypeptides are overexpressed in cancer tissues compared to normal tissues, and may thus serve as effective targets for the diagnosis and treatment of cancer in mammals. The invention also relates to nucleic acid and polypeptide and capture and both relations and methods and compositions are norganic coid; an autibody specific for a TAT polypeptide; a peptide or organic molecule which binds to a TAT polypeptide; the treatment or TAT polypeptide; and methods and compositions for the treatment or diagnosis of cancer in mammals. TAT polypeptides, nucleic acids, antibodies, antagonists, binding molecules and compositions are useful for diagnosing or treating a cell proliferative disorder associated with increased TAT appression, particularly cancers such as breast cancer, colorectal cancer, lung cancer, ovarian cancer, liver cancer, bladder cancer, pancreatic cancer, cervical cancer, liver cancer, bladder cancer, pancreatic cancer, cervical cancer, ovarian and selves and gene mapping, in chromosome identification and in gene therapy. The present sequence represents a TAT nucleic acids may further be represents and penter invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention relates to a novel screening method identified as a multiparameter high throughput screening (MPHTS) assay. Specifically, it refers to an assay that utilises the disease signature of a plurality of specific genes associated with a particular disease, and identifies differential expression between those cells taken from individuals differential expression between those cells taken from individuals convention then describes the screening of candidate pharmaceutical compounds to identify those that have a potential therapeutic benefit for the treatment of neuropsychiatric and neurodegenerative disorders including schizophrenia, bipolar affective disorder (BAD) and autism, as well as Parkinson's and Alzheimer's disease. Accordingly, the compounds of this invention exhibit various activities including neuroleptic, notropic, antimanic and autidepressant. Furthermore, the screening etchod used in MPHTS will be automated, such that a large number of test compounds may be rapidly screened with a minimal amount of labour and effort. This polynucleotide is a human cDNA sequence of a gene that is different and every and second of the presence of a therapeutic compound and second of the compound and second of the compound and second of the compounds may be rapidly screened with a minimal amount of labour and effort. This polynucleotide is a human cDNA sequence of a gene that is
                                                                                                                                                                                                                                                                                                                                                                                         æ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        represents an exemplary efficacy gene for bipolar affective disorder, given in an exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                 Identifying a compound that can treat disease or disorders, such as, neuropsychiatric disorder e.g., schizophrenia, or autism, comprises determining the expression of one or more efficacy genes in a cell

DNA encoding novel human diagnostic protein #22979.

```
reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II) The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal genes. (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of supplement. (II) and its binding partners are useful in medical imaging olypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations in diagnostics, forensics gene mapping, identification of mutations and to produce other types of data and products dependent on DNA and amino acid sequences. AAS64197.AAS94564 represent novel human diagnostic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to isolated polynucleotide (I) and polypeptide (II)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  coding sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The invention relates to primers for synthesising full length cDNA clones 30 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5' and 3' ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful length clones were obtained by construction of full length encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a full length human cDNA of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                           830 Primers useful for synthesizing full length cDNA clones and their use
                                                                                                                                                                                                                                                                                                                                                  Ξ

This invention relates to a novel primers useful for synthesising full length cDNA molecules that encode human proteins. Specifically, it refers to secretory or membrane proteins that are potential therapeutic agents/ target molecules in the field of medicine, and in particular genes encoding proteins that are associated with signal transduction, glycoproteins and transcription. The present invention describes a method for efficiently cloning a full length human cDNA from both the 5' and 3' ends using the oligo-capping method. This polynucleotide sequence is a full length human cDNA from both the 5' and 3' entl length human cDNA from both the 5' and 3' full length human cDNA clone of the invention.
                                                                                                                                                                                                                                                                                                                             oligonucleotide primers (830 cDNAs) useful for synthesizing full

```
The invention relates to primers for synthesising full length CDNA clones. 830 CDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'- and 3'-ends of the CDNA molecules have been determined. Primers for synthesising the full length CDNA male useful for clarifying the function of the protein encoded by the CDNA. The full length clones were obtained by construction of full length enriched CDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length CDNA asily without any special methods. The present sequence is a full length human cDNA of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly
                                                                                                                                             830 Primers useful for synthesizing full length cDNA clones and their use
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           STATE; immunogen; STATE activation; allergy; inflammation; state; immunogen; STATE activation; allergy; inflammation; autoimmune disease; diabetes; hyperlipidaemia; infection; cancer; Thl hyperactive disease; rheumatoid arthritis; osteoarthritis; systemic lupus erythematosus; sepsis; asthma; allergic rhinitis; ischaemic heart disease; subarachnoid haemorrhage; viral hepatitis; AIDS.

The invention relates to a purified protein promoting signal transducer and activator of transcription 6 activation (STAT6). The protein is useful for the producing an antibody, which involves administering the protein or its epitope-bearing fragments to a non-human animal as an antigen. The nucleic acid is useful for diagnosing a disease or carefully to a disease related to expression or activity of the protein. A transformant expressing the protein is useful for screening compounds which inhibit or promote STAT6 activation. A transformant or promote STAT6 activation. A transformant composition. Compositions, antibodies and antisense molecules are useful for the treating a disease associated with STAT6 activation such as allergic diseases, inflammation, autoimmune diseases, diabetes, chyperlipidaemia, infections disease and cancers. Compositions are useful for treating disease associated with STAT6 activation and/or prevention of the hyperactive diseases. Compositions are also useful in rheumatoid attricts, systemic lupus erythematosus, sepsis asthma, allergic rhinitis, ischaemic heart diseases, subarachnoid haemorrhage, viral hepatitis and AIDS. The protein has efficient promoting STAT6 activity. The protein or nucleic acid is effectively useful for screening compounds for treating and preventing disease associated with excessive compounds for treating and preventing disease associated with excessive compounds for treating and preventing disease associated with excessive compounds for treating and preventing disease associated with excessive compounds for treating and preventing disease associated with excessive compounds for treating and preventing disease associated with excessive detired to or inhibition of STAT6. The present sequence represents a processive details and preventing descention of stative definition of stative details and details when the present sequence or details and details when the details and details details descenting details and details details details details details details details 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        human; medicine; signal transduction; glycoprotein; transcription; oligo-capping method; 88; gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     human cDNA encoding a protein which promotes STAT6 activation.

```
The present invention relates to the isolation of canine and feline oncofoetal leucine-rich glycoproteins known as 574, and the concofoetal leucine-rich glycoproteins known as 574, and the polynucleotide sequences encoding them. The 574 proteins are expressed in a significant proportion of tumours. The sequences of the invention are useful in a pharmaceutical composition for the prevention and/or treatment of tumours or other diseases associated with cells.

Cr proliferation, infections, and inflammatory conditions in animals, preferably dogs or cats. The compositions may also be used for cancer immunotherapy in these animals. The sequences of the invention may also be used in disquestic kits for rapid, reliable, sensitive, and specific measurement and localisation of 574 in extracts of plasma, urine, this use useful for isolating foetal cells from maternal blood. The protein are useful for isolating foetal cells from maternal blood. The colls may then be subject to biochemical or genetic sampling used for testing foetal abnormalities, or to determine the sex of the foetus(es).

The present sequence encodes feline 574 protein
This invention relates to a novel primers useful for synthesising full length cDNA molecules that encode human proteins. Specifically, it refers to secretory or membrane proteins that are potential therapeutic agents/ target molecules in the field of medicine, and in particular genes encoding proteins that are associated with signal transduction, glycoproteins and transcription. The present invention describes a method for efficiently cloning a full length human cDNA from both the 5' and 3' ends using the oligo-capping method. This polynucleotide sequence is a full length human cDNA clone of the invention.

/product= "5T4 protein"

WO200238612-A2

16-MAY-2002

```
The invention relates to a novel Major Histocompatibility Complex (WHC) class I peptide epitope of the 5T4 antigen. The invention further class I peptide epitope of the 5T4 antigen. The invention further browning the statement of the 5T4 epitope; a uncleic acid sequence encoding the 5T4 epitope or a polyepitope string of the 5T4 epitope or a caid to a cell; a cell pulsed with the 5T4 epitope, a polyepitope of the 5T4 epitope, its encoding nucleic acid, or the vector system; a vaccine comprising the above; a method for treating and/or preventing a disease in a subject by administering the vaccine; an agent capable of binding specifically to the 5T4 epitope and/its encoding nucleic acid, a method comprising detecting the presence of the 5T4 epitope or its encoding nucleic acid in a subject, and a T cell line or clone capable of mucleic acid in a subject, and a T cell line or clone capable of specifically recognising the 5T4 epitope has cytostatic activity. The vaccine comprising the 5T4 epitope has cytostatic activity. The vaccine comprising the 5T4 epitope or its encoding nucleic acid and the vector system or cell is useful in the prevention and/or treament of a disease, partenent of a lagrace coff the 5T4 epitope or its nucleic acid and the vector system or cell is useful for detecting the presence of the 5T4 epitope or its nucleic acid. The T cell line or clone is useful in the manufacture of a medicament for treating and/or preventing a disease. This polynucleotide sequence represents the feline or clone of the factor of a medicament for treating and/or preventing a disease. This polynucleotide sequence represents the feline or state of the invention.
                                                                                                                                                                                                                                                                                                                                                                   major histocompatibility complex class I peptide epitopes from human tumor-associated antigen, useful for preventing and/or treating a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 1260 BP; 221 A; 451 C; 346 G; 241 T; 0 U; 1 Other;

II peptide epitope of the 5T4 antigen. The vaccine or T-cell line or clone has a cytostatic activity, as it is useful in manufacturing a medicament for preventing and/or treating a disease, particularly cancer. The methods are useful for detecting T-cells capable of specifically recognising a peptide epitope in conjunction with an MHC molecule, for diagnosling or monitoring the progression of a cancerous disease, or for detecting the presence of a peptide or nucleic acid using an agent. The MHC class II peptide epitope of the invention can be used in gene therapy or as part of a vaccine. This polymucleotide sequence represents the DNA
                                                                                                                                                                                                                                                                                                                                                                         New Major Histocompatibility Complex class II peptide epitope of 5T4, useful for manufacturing a medicament for diagnosing, preventing and/or treating a disease, e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a Major Histocompatibility Complex (MHC) class

                                                                                                           The invention relates to a novel enterohaemorragic Escherichia coli 0157:H7-specific nucleic acid molecule. A polynucleotide of the invention has anti-bacterial activity. The polypeptide can be used in detection and/or treatment of 0157:H7 infection. The nucleotide sequence of the genome of Enterohaemorragic E coli 0157:H7 was determined. The present sequence represents an E. coli 0157:H7-specific nucleic acid of the

The invention relates to an isolated DNA molecule comprising an B. coll strain 0157:H7 sequence selected from a clostridial cytotoxin-like gene, a urease gene cluster. a RYX toxin-like gene cluster. a locus of a urease gene cluster. a RYX toxin-like gene cluster. a locus of antercoyte effacement and 2 genes from its associated lymphocytic phage cantercoyte effacement and 2 genes from its associated lymphocytic phage 10157:H7 can cause food polsoning, specifically acute hemomorphagic collitis (which can develop into haemolytic uraemic syndrome). Also included are an isolated DNA molecule comprising a nucleotide sequence identical to at least 25 contiguous nucleotides contained in DNA sequences selected from ACD18988ACD19242 (being 255 E.coli 0157 DNA sequences which are not count in B.coli K12), a recombinant DNA construction comprising the DNA above and a method for detecting E. coli 0157:H7 (ATCC 43895) in a sample of the 125 sequences. The DNA sequences are useful in detecting E. coli of the 255 sequences. The DNA sequences are useful in detecting E. coli infected with O157:H7, and in designing diagnostic probes which can be used to distinguish strain O157:H7 from strain K12 using molecular techniques. The present sequence is one of the 255 E. coli 0157:H7 DNA sequence (termed OZID_1-OZID255). Note: The sequence data for this patent clain form pat of form pat of form pat of form pat of fer printed specification, but was obtained in electronic format directly from the USPTO at USPTO at sequence OS field)
B. coli 0157:H7 in a sample, or in designing diagnostic probes
be used to distinguish strain 0157:H7 from strain K12 using
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ဌ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Canine, TAA, tumour-associated antigen, anti-tumour, cytostatic;

```
tissues. It appears to be strongly correlated to metastasis in colorectal and gastric cancer. 574 antigen may therefore be useful in tumour diagnosis, targeting and immunotherapy. Mice in which tumours had been induced were incculated with a virus expression vector containing the human or murine 574 gene sequence. The 574 antigen was shown to be teffective at eliciting an immunotherapeutic anti-tumour response. Both the nucleic acid encoding the antigen and the antigen itself can be used to elicit an immune response, preferably CTL or an antibody response in a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates a recombinant DNA construct comprising a polynucleotide having any of 5544 nucleotide sequences (CDNAs SEQ ID NO: 1-5544) and encoding a polypeptide with any of 5544 amino acid sequences (SEQ ID NO: 5545-11088). The CDNAs and proteins are from corn, soybean, Arabidopsis, wheat and rape but the specification does not indicate which sequences is derived from which organism. Also included is a method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New recombinant DNA constructs useful in the field of biochemistry and genetics, and in particular for producing transgenic plants with improved

producing a plant having an improved property, comprising transforming a plant with a recombinant DNA construct comprising a promoter region to plant with a recombinant DNA construct comprising a promoter region of the functional in a plant cell operably joined to a polymorelecide encoding a polypeptide associated with the property and growing the transformed collater. The property is selected from improving plant cold tolerance, for manipulating growth rate in plant cells by modification of the cell cycle pathway, for improving plant theoremse, for galactomannan production, for production of plant growth regulators, for improving plant tolerance to herbicides, for increasing the rate of homologous recombination in plants, for lignin production, for improving plant tolerance to extreme osmotic conditions, for improving plant tolerance to extreme osmotic conditions, for improving plant tolerance to extreme osmotic conditions for improvement by collegate of carbohydrate, introgen or phosphorus use and/or uptake and for yield improvement by providing improved plant growth and development under at least one stress condition. The polymucleotide may also encode a plant transcription factor. The methods and compositions of the present invention are useful in the field of biochemistry and carbohydrate, in particular for production, the present invention are useful in the field of biochemistry and flow, increasing plant tolerance to cold or heat, improving plant tolerance to plant pests or producing transgenic plants with improving plant folerance to plant pests or pathogens. They can also be used in physical carrays of molecules, plant breeding markers, computer-based storage and analysis systems. The present sequence data for this patent did controled forms part of the present sequence is one fet be sequenced analysis of the invention. Note: The sequence data for this patent did note the lettonic formst directly, from used in particular in the sequence data for this patent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 electronic format directly from USPTO at

(TAA). The TAA 5T4 is a glycoprotein which is widely expressed in carcinomas but has a highly restricted expression pattern in normal adult tissues. It appears to be strongly correlated to metastasis in colorectal and gastric cancer. 5T4 antigen may therefore be useful in tumour diagnosis, targeting and immunotherapy. Mice in which tumours had been induced were inoculated with a virus expression vector containing the present sequence. The 5T4 antigen was shown to be effective at eliciting an immunotherapeutic anti-tumour response. Both the nucleic acid encoding the antigen and the antigen itself can be used to elicit an immune response, preferably CTL or an antibody response in a subject. The present sequence appears in GenBank at accession number AJ012160 Tumor associated antigen, 5T4 capable of eliciting cytotoxic T-lymphocyte response useful in vaccinating against and in treating tumors. The present sequence encodes the mouse 5T4 tumour-associated antigen Sequence 1281 BP; 246 A; 410 C; 354 G; 271 T; 0 U; 0 Other; Example 2; Page 78; 79pp; English. (OXFO-) OXFORD BIOMEDICA UK LTD. for screening
                                                                                                                                                                                                                                                                                   The invention relates to a purified protein promoting signal transducer and activator of transcription 6 activation (STAT6). The protein is useful for the producing an antibody, which involves administering the protein or its epitope-bearing fragments to a non-human animal as an antigen. The nucleic acid is useful for diagnosing a disease or susceptibility to a disease related to expression or activity of the protein. A transformant expressing the protein is useful for screening compounds which inhibit or promote STAT6 activation. A transformant expressing the protein is useful for producing a pharmaceutical composition. Compositions, antibodies and antisense molecules are useful for the treating a disease associated with STAT6 activation such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    allergic diseases, inflammation, autoimmune diseases, diabetes, the preparation of the propertions disease and cancers. Compositions are useful for treating disease associated with STATE activation and/or prevention of Thi hyperactive diseases. Compositions are also useful in rheumatoid arthritis, osteoarthritis, systemic lupus erythematosus, sepsis, asthma, allergic rhinitis, ischemic heart diseases, subarachnoid haemorrhage, viral hepatitis and AIDS. The protein has efficient promoting STATE compounds for treating and preventing disease associated with excessive activation or inhibition of STATE. The present sequence represents a human cDNA encoding a protein which promotes STATE activation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   se; gene; human; signal transducer and activator of transcription 6; STAT6; immunogen; STAT6 activation; allergy; inflammation; autoimmuno disease; diabetes; hyperlipidaemia; infection; cancer; Thl hyperactive disease; rheumatoid arthritis; osteoarthritis; systemic lupus erythematosus; sepsis; asthma; allergic rhinitis; ischaemic heart disease; subarachnoid haemorrhage; viral hepatitis; AIDS.

The invention relates to a purified protein promoting signal transducer and activator of transcription 6 activation (STATE). The protein is useful for the producing an antibody, which involves administering the protein or its epitope-bearing fragments to a non-human animal as an antigen. The nucleic acid is useful for diagnosling a disease or susceptibility to a disease related to expression or activity of the protein. A transformant expressing the protein is useful for screening compounds which inhibit or promote STATE activation. A transformant expressing the protein is useful for producing a pharmaceutical composition. Compositions, antibodies and antisense molecules are useful for the treating a disease associated with STATE activation such as allergic diseases, inflammation, autoimmune diseases, diabetes, hyperlipidaemia, infections disease and cancers. Compositions are useful for treating disease associated with STATE activation and/or prevention of Thi hyperactive diseases. Compositions are also useful in rheumatoid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       for screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        arthritis, osteoarthritis, systemic lupus erythematosus, sepsis, asthma, allergic rhinitis, ischemic heart diseases, subarachnoid haemorrhage, viral hepatitis and AIDS. The protein has efficient promoting STATG activity. The protein or nucleic acid is effectively useful for screenin compounds for treating and preventing disease associated with excessive activation or inhibition of STATG. The present sequence represents a human cDNA encoding a protein which promotes STATG activation.
                                                                                                                                                                                                                                                                                                                                                                                          promoting purified protein, for diagnosing and treating disease associated with activation/inhibition of transcription factor e.g.
                                                                                                                                                                                                                                                                                                                                                                        signal transducer and activator of transcription 6 activation

New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.

Claim 1; SEQ ID NO 44017; 122pp; English

The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polymucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant having an improved property. The plant is a crop plant such as maize or soybean. The method of producing a transformed plant having an improved property comprises transforming a plant with the recombinant DNA construct and growing the transformed plant, where the colymnation DNA construct is useful for improving plant properties. The recombinant DNA construct is useful for producing plant properties. The recombinant DNA construct is useful for producing plant properties. The recombinant DNA construct is useful for producing plant with the improved plant properties, e.g. improved cold, heat or drought tolerance, colerance to herbicides, extreme osmotic conditions, pathogens or peets, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of homologous recombination, modified seed oil or protein yield and/or content, improved yield by modification of carbohydrate, nitrogen or phosphorus use and/or uptake, by modification of photosynthesis or by providing improved plant growth and development under at least one stress condition. This sequence represents a bacterial polynucleotide used in the scope of the invention. Note: The sequence data for this patent did not be proved the property that the property that the plant property the plant property that the plant property the plant property the plant property the plant property the plant plant property the plant p format from USPTO at seqdata.uspto.gov/sequence.html.

New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.

Claim 1; SEQ ID NO 24951; 122pp; English.

The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant cauch as maize or soybean. The method of producing a transformed plant to such as maize or soybean. The method of producing a transformed plant to such as maize or soybean. The method of producing a plant with the carecombinant DNA construct and growing the transformed plant, where the polynucleotide or polypeptide is useful for improving plant with the polynucleotide or polypeptide is useful for improving plants with improved plant properties, e.g. improved cold, heat or a drought tolerance, tolerance to herbicides, extreme osmotic conditions, pathogens or peats, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of homologous recombination, modified seed oil or protein yield and/or content, improved yield by modification of carbohydrate, nitrogen or phosphorus use and/or uptake, by modification of photosynthesis or by providing improved light, production or improved galactomannan condition, improved light, production or improved galactomannan production, this sequence represents a bacterial polynucleotide used in the scope of the invention. When sequence data for this patent did cont form part of the printed specification but was obtained in electronic format from USPTO at sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          existing in the 36-position of the first chromosome short arm (1p36) in human neuroblastoma. Also described are base sequences from the 1p36 position of human neuroblastoma call lines (NB-1 and MASS-NB-SCH-1), which are tumour suppressor genes in human neuroblastoma. The genes are tumour suppressor genes, base sequence data of which are applicable as tumour markers and reagents in studying mechanism of tumour body formation, and gene diagnosis of tumours as well as in developing anti-cancer drugs. AAF97787 to AAF97829 represent PCR primers used in the exemplification of the present invention, and AAF97891 to AAF97829.

The present invention describes the coding and protein sequences of the human kinesin-like protein HKLP. It is thought that the protein could be involved in neurological disorders, infertility, spontaneous abortion, neonatal chromsome disorders, aneuploidy and cancers. This is due to its function in the movement of microtubules. The protein shows homology to the murine KIRIA and KIRIB proteins. The sequences disclosed in the invention can be used in the isolation of similar human proteins and in vector production. In addition, the biallelic markers shown can be used in disease disgnosis and population studies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     An isolated or purified human kinesin-like protein (HKLP) encoding polynucleotide used to detect HKLP polynucleotides in a sample comprises a contiguous span of at least 12 nucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 121162 BP; 33272 A; 24108 C; 25842 G; 37919 T; 0 U; 21 Other;

Novel canine microarray-related DNA sequence SeqID587

(first entry)

21-OCT-2004

```
The sequence is upstream of a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 and 500 by with an (AC)15 and a (TC)15 olds overlected brobe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites on the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the sequence information for gpecification and indexed herein (see below). The sequences upstream and compatream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp.

The consistent of in vitro amplification of the corresp.

The sequence of clentify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          - used in genetic identification, gene

Claim 1; SEQ ID NO 587; 41pp; English

```
This invention is related to a novel isolated canine nucleic acid
sequences and the construction of canine microarrays containing a
significant portion of the canine genome. The isolated canine nucleic
acid sequences of the invention may be useful for drug screening and
coxicity assays. The invention is therefore useful for assessing the
impact, including toxicity, of a compound, pharmaceutical agent or
environmental pollutant on a cell or living organism. The methods are
useful for detecting genes that are up- or down-regulated in canines in
disease state. The sequences are useful as diagnostic agents or markers
to detect a cellular response in a sample individually or as part of
a conducting electronic Northerns that allow the user to determine that
modulate gene expression or activity. The database is useful for
producing electronic Northerns that allow the user to determine the cell
type or tissue in which a given gene is expressed and to allow
controllar tissue or cell. The methods are useful for determining the
particular tissue or cell. The methods are useful for determining the
similarity of a toxic response to one or more individual compounds. The
methods are useful for predicting at least one toxic response or the
similarity of a toxic response to one or more individual compounds. The
methods are useful for predicting at least one toxic response or the
similarity be toxing themethods are also useful for predicting or elucidating
the toxins. The methods are also useful for predicting or elucidating
the potential cellular pathways influenced, induced or modulated by the
compound or test agent due to the similarity of the expression profile
compound or test agent due to the similarity of the expression profile
compound or test agent the toxin which was known toxin. The present sequence
compound or test agent the toxin as a profile induced by a known toxin. The present sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 584 BP; 149 A; 107 C; 127 G; 167 T; 0 U; 34 Other;

                                                                                                                                                                     The present invention relates to methods of screening cancer-linked genes and expression products for cancer diagnosis, and for screening potential anti-cancer agents. Specifically claimed is a method of identifying (M1) an agent that modulates activity of cancer-related genes, by contacting a compound with a cell expression and detecting difference in expression relative to when the compound is not present. Also claimed are methods of identifying (M2) an anti-neoplastic agent, by contacting a cell exhibiting neoplastic activity with a compound first identified as a cancer related gene activity with a compound first identified as a cancer related gene activity with a compound first identified as a cancer related gene activity with a compound first identified as a cancer related gene condition and detecting a decrease in the neoplastic, or administering agent identified by (M1) to an animal exhibiting a cancer condition and detecting a decrease in the cancerous condition. Also given the protein (I), which has at least one immunogenic fragment; an antibody that reacts with a protein; an immunoconjugate comprising the antibody and a cytocoxic agent. The agent is useful for treating cancer, by contacting a cancerous cell in vivo with an agent having activity by eliciting the production of cytotoxic I lymphocytes specific for the specification. The agent is also useful for treating cancer in an animal by eliciting the production of cytotoxic I lymphocytes specific for the proteins are anion transport proteins specific for prostate cancer. The protein sequence is cDNA encoding a prostate cancer. The protein CGI-96, unigene cluster Hs.360940.

P-PSDB; ABR54190

Novel human proteins and nucleic acid encoding the proteins, useful for diagnosis, treatment and prevention of disorders involving the human protein or nucleic acid e.g. cardiac and neurological disorders.

Claim 20; Page 118-119; 460pp; English.

The present invention describes isolated human NOVX proteins, where X is

1 to 42. ACC62236 to ACC62345 encode the human NOVX proteins given in

ABR542167 to ABR54226. NOVX sequences have antiatheroscolerotic, cardiant,

phypotensive, dermatological, anorectic, immunosuppressive, cytostatic,

antidiabetic, antiinfertility, haemostatic, antiinflammatory, anti-HIV,

antidatic, metabolic, immunomodulator, neuroprotective, nootropic,

antiparkinsonian and antilipaemic activities, and can be used in gene

therapy. NOVX proteins are useful for treating or preventing a pathology

associated with the human disease. NOVX nucleic acids, proteins and

associated with the human disease. NOVX nucleic acids, proteins and

antibodies can be used in the treatment and diagnosis of cardiomyopathy,

attherosclarosis, hypertension, congenital heart defects, acrtic stenosis,

valve disease, tuberous sclerosis, scleroderma, obesity, transplantation,

congenital adrenal hyperplasia, prostate cancer, diabetes, metabolic

disorders, neoplasm, lymphoma, uterus cancer, fertility, haemophilia,

hypercoagulation, idiopathic thrombocytopenic purpura, graft versus host

disease, AIDS, bronchial asthma, Crohn's disease, multiple sclerosis,

infectious disease, parkinson's disease, immune disorders,

haematopolete, disorders, danceranders, dand metabolic syndrome x.

Alzheimer's disease, Parkinson's disease, immune disorders,

congenitation, diopathic thrombogypepenic purpura, graft versus host

disease, AIDS bronchala, cancer, fertility, haemophilia,

hypercosquibation, ridiopathic strombogypepenic purpura, graft versus host

alzheimer's disease, parkinson's disease, immune disorders,

Alzheimer's disease, anoresent graft propes for human NOVX

sequences, which are used in examples from the present invention.

Abs. human hyperplasente a human trypsinogen protein given in comparison with the human NOV35b protein in the exemplification of the present invention

(first entry) 06-NOV-2003 cDNA encoding human homologue of fruit fly kraken.

Anorectic, antinflammatory; cardiant; hypotensive; antidiabetic; neuroprotective; pharmaceutical composition; body-weight regulation; thermogenesis; metabolic; obesity; Syndrome X; insulin-resistance; eating disorder; cachexia; diabetes mellitus; hypertension; gallstone; pancreatic dysfunction; arteriosclerosis; coronary heart disease; gene; hypercholesterolaemia; dyslipidaemia; osteoarthritis; ROS defence; ss; reactive oxygen species; neurodegenerative; mitochondrial; gene therapy; human; kraken.

```
The invention relates to a novel pharmaceutical composition comprising a nucleic acid molecule or polypeptide which is a human homologue of a Drosophila melanogaster polypeptide or polynucleotide. The composition of the invention may be utilised during the diagnosis, study, prevention and treatment of diseases related to body-weight regulation and thermogenesis including metabolic disorders such as obesity, Syndrome X and insuling cresistance syndrome and eating disorders e.g. cachexis, diabetes mellitus, hypertension, pancreatic dysfunctions, arteriosolerosis, coronary heart disease, hypercholesterolaemia, dyslipidaemia, coronary heart disease, hypercholesterolaemia, disorders related to reactive osteoarthritis and gallstones. Furthermore, disorders related to reactive neurodegenerative disorders or mitochondrial disorders. Flanally, the composition of the invention may be useful in gene therapy. The current sequence is that of the cDNA encoding the human homologue of fruit fly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New pharmaceutical composition, useful for the manufacture of an agent for diagnosing, treating or preventing disorders related to body-weight regulation and thermogenesis, e.g., metabolic diseases such as obesity.
                                                                                          /*tag= a

New nucleic acid molecule and encoded polypeptide, for diagnosing, preventing or treating cell proliferative disorders such as cancer WPI; 2004-534300/51.

The present invention describes an isolated tumour-associated antigenic target (TAT) nucleic acid comprising: (a) any of 4622 nucleotide sequences (see SRQ ID NO:1 to 4622); (b) the full-length coding region of (a); (c) the complement of (a) or (b); (d) a sequence that has 80% sequence identity to (a)-(c); or (e) a sequence that hybridises to (a)-(c). Also described: (1) an expression vector comprising the above comprising the above expression vector; (a) a process for producing a polypeptide; (4) an isolated polypeptide comprising (a) an amino acid sequence encoded by the full-notetide sequences; (b) an amino acid sequence encoded by the full-notetide sequences; (b) an amino acid sequence encoded by the full-notetide sequences; (b) an amino acid sequence encoded by the full-notetide sequences; (b) an amino acid sequence encoded by the full-comprising the above polypeptide fueed to a heterologous polypeptide comprising the above polypeptide fueed to a heterologous polypeptide; (c) an isolated antibody that binds to the above polypeptide; (f) a process comprising the antibody; (8) an isolated oligopeptide; (7) a process composition of matter comprising to the above polypeptide; (f) a tumour-associated antigenic target (TAT) binding organic molecule that binds to the above polypeptide; (10) a composition of matter comprising the above polypeptide or TAT binding organic molecule, in combination with a carrier; (11) an article of manufacture comprising a container and the container; (12) method of the growth of the cell is at least in part dependent upon a growth the protein of persented above protein; (14) a method of containing the protein ammanal; (15) a method of diagnosing the presence of a tumour in a mammal; (16) a method for treating or preventing or cell promise of the above contained with increased expression or activity of the above protein; and (17) a method of hinding an antibody, oligoprotein; and (17) a method of hinding an antibod of hinding an antibod of hinding an antibod of hinding an antibod of preventing or treating cancer. The composition is also used for preparing medicament for the therapeutic treatment or diagnostic detection of a sill proliferative disorder or cancer. The present sequence represents a protein; and (17) a method of binding an antibody, oligopeptide or organic molecule to a cell that expresses the protein described above. The TAT sequences have cytostatic activities, and can be used in gene therapy. The composition and methods are useful for diagnosing, human TAT cDNA sequence from the present invention.

Novel human proteins and nucleic acid encoding the proteins, useful diagnosis, treatment and prevention of disorders involving the human protein or nucleic acid e.g. cardiac and neurological disorders.

Claim 20; Page 119; 460pp; English.

hypotensive, dermatological, anotectic, imminosuppressive, cytostatic, antidabetic, antidetility, haemostatic, antidabetic, antidetility, haemostatic, antidabetic, antidabetic, antidabetic, metabolic, immunomodulator, neuroprotective, noctropic, antidatabetic, metabolic, immunomodulator, neuroprotective, noctropic, antidatabetic, metabolic, immunomodulator, neuroprotective, noctropic, associated with a NoVX protein in humans and for treating a syndrome associated with a NoVX protein in humans and for treating a syndrome associated with the human disease. NoVX nucleic acids, proteins and antibodies can be used in the treatment and diagnosis of cardiomyopathy, alversosilenosis, proteins and antibodies can be used in the treatment and diagnosis of cardiomyopathy, alverdise can be used in the treatment and diagnosis of cardiomyopathy, valve disease, tuberous sclerosis, scleroderma, obesity, transplantation, congenital adrenal hyperplasia, prostate cancer, diabetes, metabolic disease, anorexia, cancer. sesociated caches, metabolic disease, anorexia, cancer-associated cachesia, cancer, hemanopoietic disorders, anorexia, cancer-associated cachesia, cancer, Alzheimer's disease, anorexia, cancer-associated cachesia, cancer, Alzheimer's disease, Parkinson's disease, immune disorders, heman NOVX sequences, which are used in examples from the present invention.

ARS4277 represents a human trypabinogen protein given in comparison with the human NOV35b protein in the exemplification of the present invention The present invention describes isolated human NOVX proteins, where X is 1 to 42. ACC62236 to ACC62345 encode the human NOVX proteins given in ABR54167 to ABR54276. NOVX sequences have antiatherosclerotic, cardiant,

```
The present invention relates to methods of screening cancer-linked genes and expression products for cancer diagnosis, and for screening potential anti-cancer agents. Specifically claimed is a method of identifying (Mt) an activate modulates activity of cancer-related genes, by contacting a compound with a cell expressing a gene under conditions promoting the expression of gene, and detecting difference in expression relative to when the compound is not present. Also claimed are methods of identifying (M2) an anti-neoplastic agent, by contacting a cell exhibiting neoplastic activity with a compound first identified as a cancer related gene modulator by (M1), and detecting a decrease in the neoplastic, or administering agent identified by (M1) to an animal exhibiting a cancer condition and detecting a decrease in the cancerous condition. Also given a tip a protein (I), which has at least one immunogenic fragment; an antibody that reacts with a protein; an immunoconjugate comprising the protein the agent is useful for treating cancer, or antibody and a cytotoxic agent. The agent is useful for treating cancer, and animal and activity against an expression produced encoded by a gene sequence given in the specification. The agent is also useful for treating cancer in an animal, and an expression produced encoded by a gene sequence given in the proteins are anion transport proteins appealing prostate cancer. The protein and sequence is variant 4 DNA encoding a prostate cancer. The present and anion transport proteins appear protein appears and a protein and anion transport proteins appears to prostate cancer. The protein and anion transport proteins appears to prostate cancer. The appear are anion transport proteins appears to prostate cancer. The appear are anion transport proteins appears to protein a protein and anion transport proteins are cancer. The appears are anion transported to a protein appears and a protein appears and a protein and anion transport and anion transported and a protein appears appears and 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     contacting compound with cell, to promote expression of gene, and detecting difference in expression of gene relative to when compound is
                                                                                                                                                                                                                                                                                                                                                                                                                                                        à

Human purified secretory polynucleotide (sptm), seq id 152 

Antiarteriosclerotic; antipsoriatic; cytostatic; secretory molecule;

Homo sapiens

```
The invention relates to isolated purified secreted polynucleotides (sptm) (1), and the polypeptides (SPTM) encoded by sptm. A polypeptide encoded by (1) is used to identify a compound which binds to it. A microarray comprising (1) is used to generate a transcript. (1) is used to screen a compound for effectiveness in altering expression of (1). Is used to assess toxicity of a test compound. An agonist or antagonist identified by a new method is used in a pharmaceutical composition. The secretory molecules are used to diagnose or treat conditions, diseases or disorders associated with cell signaling e.g. arteriosclerosis, psoriasis, and cancer. Sequences given in ADI40308-ADI40468 represent human purified secretory polynucleotides of the invention, and those given in ADI40369-ADI40631 represent the polypeptides they encode.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Jones AL, Dahl CR, Gietzen D, Chinn J, Dufour GB, Jackson JL; Yu JY, Tuason O, Yap PB, Amshey SR, Dam TC, Liu TF, Gerstin EH; Peralta CH, Lewis SA, Chen AJ, Marwaha R, Lan RY, Urashka MB; Kristnam SR, Kolluru V, Panesar IS;
